For my database artifact, I chose a project I originally completed in DAD 220. THe project uses SQL to manage customer, order, and returned merchandise authorization (RMA) information. I selected this artifact because it demonstrates my understanding of relation databases and gave me an opportunity to improve my SQL skills.

For my enhancement, I recreated the database in MySQL and improved how the information can be retrieved and displayed. I added queries that join customer and order information, calculate the total amount spent by each customer, and connect RMA records with their related customers and orders. These changes make the database more useful and demonstrate my ability to work with multiple related tables.

I believe the enhancements met the course outcomes I originally planned to address. It demonstrates my ability to use database tools and SQL to organize data and retrieve useful information. I did not make any major changes to my original outcome plan.

One challenge I faced was setting up MySQL correctly on my computer and getting the database to run locally. I also encountered some errors when tables or records already existed. Working through these problems helped me become more comfortable with MySQL and troubleshooting database issues. Overall, this enhancement helped improve both the original artifact and my understanding of relation databases.
